1 2 3 4 5

1KSG **Complex of Arl2 and PDE delta, Crystal Form 1**

Characteristics **Release Date:** 08-May-2002 **Exp. Method:** X Ray Diffraction
Resolution: 2.30 Å

Classification **Signaling Protein/hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Arf Like Protein 2 **Mutation:** S33L **Mol. Id:** 2 **Molecule:** Retinal Rod Rhodopsin Sensitive Cgmp 3' 5' Cyclic Phosphodiesterase Delta Subunit

Authors **Hanzal-Bayer, M., Renault, L., Roversi, P., Wittinghofer, A., Hillig, R.C.**

1KSH **Complex of Arl2 and PDE delta, Crystal Form 2 (native)**

Characteristics **Release Date:** 08-May-2002 **Exp. Method:** X Ray Diffraction
Resolution: 1.80 Å

Classification **Signaling Protein/hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Arf Like Protein 2 **Mutation:** S33L **Mol. Id:** 2 **Molecule:** Retinal Rod Rhodopsin Sensitive Cgmp 3' 5' Cyclic Phosphodiesterase Delta Subunit

Authors **Hanzal-Bayer, M., Renault, L., Roversi, P., Wittinghofer, A., Hillig, R.C.**

1KSJ **Complex of Arl2 and PDE delta, Crystal Form 2 (SeMet)**

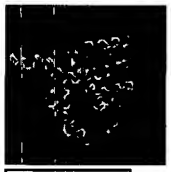
Characteristics **Release Date:** 08-May-2002 **Exp. Method:** X Ray Diffraction
Resolution: 2.60 Å

Classification **Signaling Protein/hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Arf Like Protein 2 **Mutation:** S33L **Mol. Id:** 2 **Molecule:** Retinal Rod Rhodopsin Sensitive Cgmp 3' 5' Cyclic Phosphodiesterase Delta Subunit

Authors **Hanzal-Bayer, M., Renault, L., Roversi, P., Wittinghofer, A., Hillig, R.C.**

☑ 1TAZ



Catalytic Domain Of Human Phosphodiesterase 1B

Characteristics **Release Date:** 03-Aug-2004 **Exp. Method:** X Ray Diffraction

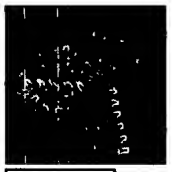
Resolution: 1.77 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Calcium/calmodulin Dependent 3' 5' Cyclic Nucleotide Phosphodiesterase 1b **Fragment:** Catal Domain

Authors **Zhang, K.Y.J., Card, G.L., Suzuki, Y., Artis, D.R., Fong, D., Gillette, S., Hsieh, D., Neiman, J., West, B.L., Zhang, C., Milburn, M.V., Kim, S.-H., Schlessinger, J., Bollag, G.**

☑ 1XP0



Catalytic Domain Of Human Phosphodiesterase 5A In Complex With Vardenafil

Characteristics **Release Date:** 14-Dec-2004 **Exp. Method:** X Ray Diffraction

Resolution: 1.79 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain of Human Phosphodiesterase 5a

Authors **Card, G.L., England, B.P., Suzuki, Y., Fong, D., Powell, B., Lee, B., Luu, C., Tabrizizad, M., Gillette, S., Ibrahim, P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessing J., Zhang, K.Y.J.**

☑ 1Z1L

The Crystal Structure of the Phosphodiesterase 2A Catalytic Domain

Characteristics **Release Date:** 21-Jun-2005 **Exp. Method:** X Ray Diffraction

Resolution: 1.70 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Dependent 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain Residues 578 9

Authors **Iffland, A., Kohls, D., Low, S., Luan, J., Zhang, Y., Kothe, M., Cao, Q., Kamath, A.V., Ding, Y.H., Ellenberger, T.**

☑ 1KN4

CATALYTIC ANTIBODY D2.3 COMPLEX

Characteristics **Release Date:** 13-Mar-2002 **Exp. Method:** X Ray Diffraction

Resolution: 1.90 Å

Classification **Immune System**

Compound **Mol. Id:** 1 **Molecule:** Ig Antibody D2.3 (light Chain) **Mol. Id:** 2 **Molecule:** Ig Antibody D2.3 (heavy Chain)

Authors **D`Souza, L.J., Gigant, B., Knossow, M., Green, B.S.**

☑ 1RKP

Crystal structure of PDE5A1-IBMX

Characteristics **Release Date:** 30-Mar-2004 **Exp. Method:** X Ray Diffraction

Resolution: 2.05 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain (residues 535 860

Mutation: I778L

Authors **Huai, Q., Liu, Y., Francis, S.H., Corbin, J.D., Ke, H.**

☑ 1T9R

Catalytic Domain Of Human Phosphodiesterase 5A

Characteristics **Release Date:** 03-Aug-2004 **Exp. Method:** X Ray Diffraction

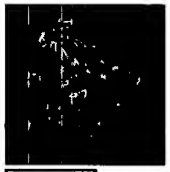
Resolution: 2.10 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain

Authors **Zhang, K.Y.J., Card, G.L., Suzuki, Y., Artis, D.R., Fong, D., Gillette, S., Hsieh, D., Neiman, J., West, B.L., Zhang, C., Milburn, M.V., Kim, S.-H., Schlessinger, J., Bollag, G.**

☑ 2H40



Crystal structure of the catalytic domain of unliganded PDE5

Characteristics **Release Date:** 06-Jun-2006 **Exp. Method:** X Ray Diffraction

Resolution: 1.85 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain Residues 535 860

Authors **Wang, H., Liu, Y., Huai, Q., Cai, J., Zoraghi, R., Francis, S.H., Corbin, J.D., Robinson, H., X Z., Lin, G., Ke, H.**

1 2 3 4 5

2H44

Crystal structure of PDE5A1 in complex with icarisid II

Characteristics **Release Date:** 06-Jun-2006 **Exp. Method:** X Ray Diffraction

Resolution: 1.80 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain Residues 535 860

Authors **Wang, H., Liu, Y., Huai, Q., Cai, J., Zoraghi, R., Francis, S.H., Corbin, J.D., Robinson, H., Xia, Z., Lin, G., Ke, H.**

1XOZ

Catalytic Domain Of Human Phosphodiesterase 5A In Complex With Tadalafil

Characteristics **Release Date:** 14-Dec-2004 **Exp. Method:** X Ray Diffraction

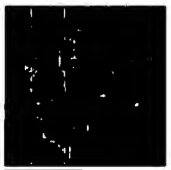
Resolution: 1.37 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain of Human Phosphodiesterase 5a

Authors **Card, G.L., England, B.P., Suzuki, Y., Fong, D., Powell, B., Lee, B., Luu, C., Tabrizizad, M., Gillette, S., Ibrahim, P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessinger J., Zhang, K.Y.J.**

1FZQ



CRYSTAL STRUCTURE OF MURINE ARL3-GDP

Characteristics **Release Date:** 06-Dec-2000 **Exp. Method:** X Ray Diffraction

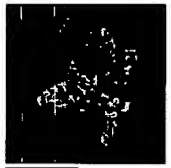
Resolution: 1.70 Å

Classification **Signaling Protein**

Compound **Mol. Id:** 1 **Molecule:** Adp Ribosylation Factor Like Protein 3

Authors **Hillig, R.C., Hanzal-Bayer, M., Linari, M., Becker, J., Wittinghofer, A., Renault, L.**

☑ 1TBF



Catalytic Domain Of Human Phosphodiesterase 5A in Complex with Sildenafil

Characteristics **Release Date:** 03-Aug-2004 **Exp. Method:** X Ray Diffraction

Resolution: 1.30 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain

Authors **Zhang, K.Y.J., Card, G.L., Suzuki, Y., Artis, D.R., Fong, D., Gillette, S., Hsieh, D., Neiman, J., West, B.L., Zhang, C., Milburn, M.V., Kim, S.-H., Schlessinger, J., Bollag, G.**

☑ 1X2A

Crystal Structure of e.coli AspAT complexed with N-phosphopyridoxyl-D-glutamic acid

Characteristics **Release Date:** 14-Jun-2005 **Exp. Method:** X Ray Diffraction

Resolution: 2.20 Å

Classification **Transferase**

Compound **Mol. Id:** 1 **Molecule:** Aspartate Aminotransferase

Authors **Islam, M.M., Goto, M., Miyahara, I., Ikushiro, H., Hirotsu, K., Hayashi, H.**

☑ 2H42

Crystal structure of PDE5 in complex with sildenafil

Characteristics **Release Date:** 06-Jun-2006 **Exp. Method:** X Ray Diffraction

Resolution: 2.30 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain Residues 535 860

Authors **Wang, H., Liu, Y., Huai, Q., Cai, J., Zoraghi, R., Francis, S.H., Corbin, J.D., Robinson, H., Z., Lin, G., Ke, H.**

☑ 1UHO

Crystal structure of Human Phosphodiesterase 5 complexed with Vardenafil(Levitra)

Characteristics **Release Date:** 09-Jul-2004 **Exp. Method:** X Ray Diffraction

Resolution: 2.50 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain

Authors **Sung, B.-J., Hwang, K.Y., Jeon, Y.H., Lee, J.I., Heo, Y.-S., Kim, J.H., Moon, J., Yoon, J.M., Hyun, Y.-L., Kim, E., Eum, S.J., Park, S.-Y., Lee, J.-O., Lee, T.G., Ro, S., Cho, J.M.**

☑ 1XOS

Catalytic Domain Of Human Phosphodiesterase 4B In Complex With Sildenafil

Characteristics **Release Date:** 14-Dec-2004 **Exp. Method:** X Ray Diffraction

Resolution: 2.28 Å

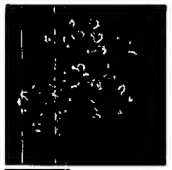
Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain of Human Phosphodiesterase 4b

Authors **Card, G.L., England, B.P., Suzuki, Y., Fong, D., Powell, B., Lee, B., Luu, C., Tabrizizad, M., Gillette, S., Ibrahim, P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessing J., Zhang, K.Y.J.**

☑ **1ZKL**

Multiple Determinants for Inhibitor Selectivity of Cyclic Nucleotide Phosphodiesterases



Characteristics **Release Date:** 05-Jul-2005 **Exp. Method:** X Ray Diffraction

Resolution: 1.67 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** High Affinity Camp Specific 3' 5' Cyclic Phosphodiesterase 7a **Fragment:** Catalytic Domain (1 482)

Authors **Wang, H., Liu, Y., Chen, Y., Robinson, H., Ke, H.**

☑ **1FQJ**

CRYSTAL STRUCTURE OF THE HETEROTRIMERIC COMPLEX OF THE RGS DOMAIN OF RGS9, THE GAMMA SUBUNIT OF PHOSPHODIESTERASE AND THE GT/I1 CHIMERA ALPHA SUBUNIT [(RGS9)-(PDEGAMMA)-(GT/I1ALPHA)-(GDP)-(ALF4-)-(MG2+)]

Characteristics **Release Date:** 28-Feb-2001 **Exp. Method:** X Ray Diffraction

Resolution: 2.02 Å

Classification **Signaling Protein**

Compound **Mol. Id:** 1 **Molecule:** Chimera of Guanine Nucleotide Binding Protein G(t) Alpha 1 Subunit and Guanine Nucleotide Binding Protein G(i) Alpha 1 Subunit **Mol. Id:** 2 **Molecule:** Regulator of G Protein Signaling 9 **Fragment:** Rgs Don (residues 276 422) **Mol. Id:** 3 **Molecule:** Retinal Rod Rhodopsin Sensitive Cgmp 3' 5' Cyclic Phosphodiesterase Gan Subunit **Fragment:** Pdegamma (residues 46 87)

Authors **Slep, K.C., Kercher, M.A., He, W., Cowan, C.W., Wensel, T.G., Sigler, P.B.**

1 2 3 4 5

☑ **1T9S**

Catalytic Domain Of Human Phosphodiesterase 5A in Complex with GMP

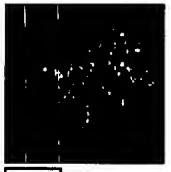
Characteristics **Release Date:** 03-Aug-2004 **Exp. Method:** X Ray Diffraction
Resolution: 2.00 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase **Fragment:** Catalytic Domain

Authors **Zhang, K.Y.J., Card, G.L., Suzuki, Y., Artis, D.R., Fong, D., Gillette, S., Hsieh, D., Neiman, J., West, B.L., Zhang, C., Milburn, M.V., Kim, S.-H., Schlessinger, J., Bollag, G.**

☑ **1SO2**



CATALYTIC DOMAIN OF HUMAN PHOSPHODIESTERASE 3B In COMPLEX WITH A DIHYDROPYRIDAZINE INHIBITOR

Characteristics **Release Date:** 11-May-2004 **Exp. Method:** X Ray Diffraction
Resolution: 2.40 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Inhibited 3' 5' Cyclic Phosphodiesterase B **Fragment:** Catalytic Domain Residues 654 1073

Authors **Scapin, G., Patel, S.B., Chung, C., Varnerin, J.P., Edmondson, S.D., Mastracchio, A., Parm E.R., Singh, S.B., Becker, J.W., Van Der Ploeg, L.H., Tota, M.R.**

☑ **1RO6**

Crystal structure of PDE4B2B complexed with Rolipram (R & S)

Characteristics **Release Date:** 07-Dec-2004 **Exp. Method:** X Ray Diffraction
Resolution: 2.00 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain
Mutation: S487A, S489A

Authors **Xu, R.X., Rocque, W.J., Lambert, M.H., Vanderwall, D.E., Luther, M.A., Nolte, R.T.**

☑ 1RO9

CRYSTAL STRUCTURES OF THE CATALYTIC DOMAIN OF PHOSPHODIESTERASE 4B2B COMPLEXED WITH 8-Br-AMP

Characteristics **Release Date:** 07-Dec-2004 **Exp. Method:** X Ray Diffraction

Resolution: 2.13 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain

Mutation: S487A, S489A

Authors **Xu, R.X., Rocque, W.J., Lambert, M.H., Vanderwall, D.E., Luther, M.A., Nolte, R.T.**

☑ 1ROR

CRYSTAL STRUCTURES OF THE CATALYTIC DOMAIN OF PHOSPHODIESTERASE 4B2B COMPLEXED WITH AMP

Characteristics **Release Date:** 07-Dec-2004 **Exp. Method:** X Ray Diffraction

Resolution: 2.00 Å

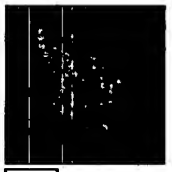
Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain

Mutation: S487A, S489A

Authors **Xu, R.X., Rocque, W.J., Lambert, M.H., Vanderwall, D.E., Luther, M.A., Nolte, R.T.**

☑ 1TBM



Crystal structure of phosphodiesterase 9 shows orientation variation of inhibitor IBMX binding

Characteristics **Release Date:** 06-Jul-2004 **Exp. Method:** X Ray Diffraction

Resolution: 2.23 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Cgmp Phosphodiesterase A2 **Fragment:** Catalytic Domain

Authors **Huai, Q., Wang, H., Zhang, W., Colman, R.W., Robinson, H., Ke, H.**

☑ 1XMU

Catalytic Domain Of Human Phosphodiesterase 4B In Complex With Roflumilast

Characteristics **Release Date:** 14-Dec-2004 **Exp. Method:** X Ray Diffraction

Resolution: 2.30 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain of Human Phosphodiesterase 4b **Mol. Id:** 2 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain of Human Phosphodiesterase 4b

Card, G.L., England, B.P., Suzuki, Y., Fong, D., Powell, B., Lee, B., Luu, C., Tabrizizad,

Authors M., Gillette, S., Ibrahim, P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessinger, J., Zhang, K.Y.J.

☑ 1XMY

Catalytic Domain Of Human Phosphodiesterase 4B In Complex With (R)-Rolipram

Characteristics **Release Date:** 14-Dec-2004 **Exp. Method:** X Ray Diffraction

Resolution: 2.40 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain of Human Phosphodiesterase 4b **Mol. Id:** 2 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain of Human Phosphodiesterase 4b

Authors Card, G.L., England, B.P., Suzuki, Y., Fong, D., Powell, B., Lee, B., Luu, C., Tabrizizad, M., Gillette, S., Ibrahim, P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessing J., Zhang, K.Y.J.

☑ 1XN0

Catalytic Domain Of Human Phosphodiesterase 4B In Complex With (R,S)-Rolipram

Characteristics **Release Date:** 14-Dec-2004 **Exp. Method:** X Ray Diffraction

Resolution: 2.31 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain of Human Phosphodiesterase 4b

Authors Card, G.L., England, B.P., Suzuki, Y., Fong, D., Powell, B., Lee, B., Luu, C., Tabrizizad, M., Gillette, S., Ibrahim, P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessing J., Zhang, K.Y.J.

☑ 1XOQ

Catalytic Domain Of Human Phosphodiesterase 4D In Complex With Roflumilast

Characteristics **Release Date:** 14-Dec-2004 **Exp. Method:** X Ray Diffraction

Resolution: 1.83 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4d **Fragment:** Catalytic Domain of Human Phosphodiesterase 4d

Authors Card, G.L., England, B.P., Suzuki, Y., Fong, D., Powell, B., Lee, B., Luu, C., Tabrizizad, M., Gillette, S., Ibrahim, P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessing J., Zhang, K.Y.J.

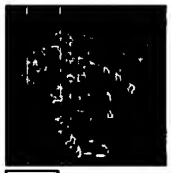
1 2 3 4 5

☑ **1XOT**



Catalytic Domain Of Human Phosphodiesterase 4B In Complex With Vardenafil

Characteristics **Release Date:** 14-Dec-2004 **Exp. Method:** X Ray Diffraction

Resolution: 2.34 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain of Human Phosphodiesterase 4b

Authors **Card, G.L., England, B.P., Suzuki, Y., Fong, D., Powell, B., Lee, B., Luu, C., Tabrizizad, M., Gillette, S., Ibrahim, P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessing J., Zhang, K.Y.J.**

☑ **1Y2B**

Catalytic Domain Of Human Phosphodiesterase 4D In Complex With 3,5-dimethyl-1H-pyrazole-4-carboxylic acid ethyl ester

Characteristics **Release Date:** 01-Mar-2005 **Exp. Method:** X Ray Diffraction

Resolution: 1.40 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4d **Fragment:** Catalytic Domain of Human Phosphodiesterase 4d

Authors **Card, G.L., Blasdel, L., England, B.P., Zhang, C., Suzuki, Y., Gillette, S., Fong, D., Ibrahim P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessinger, J., Zhang, K.Y.J.**

☑ **1Y2C**

Catalytic Domain Of Human Phosphodiesterase 4D In Complex With 3,5-dimethyl-1-phenyl-1H-pyrazole-4-carboxylic acid ethyl ester

Characteristics **Release Date:** 01-Mar-2005 **Exp. Method:** X Ray Diffraction

Resolution: 1.67 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4d **Fragment:** Catalytic Domain of Human

Phosphodiesterase 4d

Authors **Card, G.L., Blasdel, L., England, B.P., Zhang, C., Suzuki, Y., Gillette, S., Fong, D., Ibrahim P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessinger, J., Zhang, K.Y.J.**

☑ **1Y2E**

Catalytic Domain Of Human Phosphodiesterase 4D In Complex With 1-(4-amino-phenyl)-3,5-dimethyl-1H-pyrazole-4-carboxylic acid ethyl ester

Characteristics **Release Date:** 01-Mar-2005 **Exp. Method:** X Ray Diffraction

Resolution: 2.10 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4d **Fragment:** Catalytic Domain of Human Phosphodiesterase 4d

Authors **Card, G.L., Blasdel, L., England, B.P., Zhang, C., Suzuki, Y., Gillette, S., Fong, D., Ibrahim P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessinger, J., Zhang, K.Y.J.**

☑ **1Y2H**

Catalytic Domain Of Human Phosphodiesterase 4B In Complex With 1-(2-chloro-phenyl)-3,5-dimethyl-1H-pyrazole-4-carboxylic acid ethyl ester

Characteristics **Release Date:** 01-Mar-2005 **Exp. Method:** X Ray Diffraction

Resolution: 2.40 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain of Human Phosphodiesterase 4b

Authors **Card, G.L., Blasdel, L., England, B.P., Zhang, C., Suzuki, Y., Gillette, S., Fong, D., Ibrahim P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessinger, J., Zhang, K.Y.J.**

☑ **1Y2J**

Catalytic Domain Of Human Phosphodiesterase 4B In Complex With 3,5-dimethyl-1-(3-nitro-phenyl)-1H-pyrazole-4-carboxylic acid ethyl ester

Characteristics **Release Date:** 01-Mar-2005 **Exp. Method:** X Ray Diffraction

Resolution: 2.55 Å

Classification **Hydrolase**

Compound **Mol. Id:** 1 **Molecule:** Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain of Human Phosphodiesterase 4b

Authors **Card, G.L., Blasdel, L., England, B.P., Zhang, C., Suzuki, Y., Gillette, S., Fong, D., Ibrahim P.N., Artis, D.R., Bollag, G., Milburn, M.V., Kim, S.-H., Schlessinger, J., Zhang, K.Y.J.**

☑ **2CHM**

CRYSTAL STRUCTURE OF N2 SUBSTITUTED PYRAZOLO PYRIMIDINONES-A FLIPPED BINDING MODE IN PDE5

Characteristics **Release Date:** 08-Jun-2006 **Exp. Method:** X Ray Diffraction

Resolution: 1.60 Å

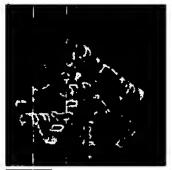
Classification **Hydrolase**

Compound **Mol. Id: 1 Molecule:** Cgmp Specific 3' 5' Cyclic Phosphodiesterase Camp Specific 3' 5' Cyclic Phosphodiesterase 4b **Fragment:** Catalytic Domain Residues (residues 534 858 with Subdomain Replaced with Pde4 Subdomain)

Authors **Allerton, C.M.N., Barber, C.G., Beaumont, K.C., Brown, D.G., Cole, S.M., Ellis, D., Lane, C.A.L., Maw, G.N., Mount, N.M., Rawson, D.J., Robinson, C.M., Street, S.D.A., Summerhill, N.W.**

☑ **1F0J**

CATALYTIC DOMAIN OF HUMAN PHOSPHODIESTERASE 4B2B



Characteristics **Release Date:** 26-Jul-2000 **Exp. Method:** X Ray Diffraction

Resolution: 1.77 Å

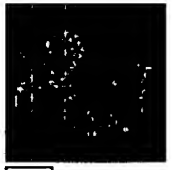
Classification **Hydrolase**

Compound **Mol. Id: 1 Molecule:** Phosphodiesterase 4b **Fragment:** Catalytic Domain **Mutation:** S487A, S489A

Authors **Xu, R.X., Hassell, A.M., Vanderwall, D., Lambert, M.H., Holmes, W.D., Luther, M.A., Rocque W.J., Milburn, M.V., Zhao, Y., Ke, H., Nolte, R.T.**

☑ **1OYN**

Crystal structure of PDE4D2 in complex with (R,S)-rolipram



Characteristics **Release Date:** 15-Jul-2003 **Exp. Method:** X Ray Diffraction

Resolution: 2.00 Å

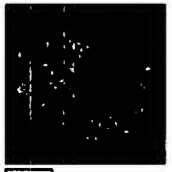
Classification **Hydrolase**

Compound **Mol. Id: 1 Molecule:** Camp Specific Phosphodiesterase Pde4d2 **Fragment:** Catalytic Domain

Authors **Huai, Q., Wang, H., Sun, Y., Kim, H.Y., Liu, Y., Ke, H.**

☑ **1Q9M**

Three dimensional structures of PDE4D in complex with roliprams and implication on inhibitor selectivity



Characteristics **Release Date:** 02-Sep-2003 **Exp. Method:** X Ray Diffraction

Resolution: 2.30 Å

Classification **Hydrolase**

Compound **Mol. Id: 1 Molecule:** Camp Specific Phosphodiesterase Pde4d2

Authors **Huai, Q., Wang, H., Sun, Y., Kim, H.Y., Liu, Y., Ke, H.**

TITLE: Proteomimetic compounds and methods

DATE-ISSUED: February 22, 2005

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Hamilton; Andrew D.	Guilford	CT		
Ernst; Justin	New Heaven	CT		
Orner; Brendan P.	Madison	WI		

US-CL-CURRENT: 514/183; 514/252.12, 544/336, 544/358, 544/392

ABSTRACT:

The present invention relates to compounds and pharmaceutical compositions which are proteomimetic and to methods for inhibiting the interaction of an alpha-helical protein with another protein or binding site. Methods for treating diseases or conditions which are modulated through interactions between alpha helical proteins and their binding sites are other aspects of the invention.

TITLE: Pyrimidine carboxamides useful as inhibitors of PDE4 isozymes

DATE-ISSUED: May 25, 2004

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Magee; Thomas Victor	Mystic	CT		
Marfat; Anthony	Mystic	CT		
Chambers; Robert James	Mystic	CT		

US-CL-CURRENT: 514/255.05; 514/269, 544/319

ABSTRACT:

This invention is directed to compounds of the formula: ##STR1##

wherein j is 0 or 1; k is 0 or 1; m is 0 or 1; n is 0 or 1; W is --O--; --S(.dbd.O).sub.t --, where t is 0, 1, or 2; or --N(R.sup.3)--; where R.sup.3 is --H, --(C.sub.1 -C.sub.3) alkyl, --OR.sup.12, phenyl, or benzyl; R.sup.C and R.sup.D have the same meaning as R.sup.A and R.sup.B, except that at least one of R.sup.C and R.sup.D must be --H; and the other variables are defined as set forth in the specification. The invention is also directed to pharmaceutical compositions comprising the above compounds and to methods of treating a subject suffering from a disease, disorder or condition mediated by the PDE4 isozyme, the method comprising administering a therapeutically effective amount of a compound as described above. The invention is particularly directed to methods of treating inflammatory, respiratory and allergic diseases and conditions, especially asthma; chronic obstructive pulmonary disease (COPD) including chronic bronchitis, emphysema, and bronchiectasis; chronic rhinitis; and chronic sinusitis.

ABSTRACTED-PUB-NO: WO2004087906A
BASIC-ABSTRACT:

NOVELTY - A mammalian phosphodiesterase 1B (PDE1B) crystal (I), comprises a fully defined sequence of 536 amino acids (S1), as given in the specification, or its homologue or variant.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) a crystal (II) of a PDE1B-PDE1B ligand complex, where the ligand is an antagonist or an inhibitor;

(2) a crystal complex (III) comprising a polypeptide with an amino acid sequence spanning amino acids Thr142 to Gln507 listed in (S1), its homologue or variant;

(3) a polypeptide (IV) comprising (S1) or its homologue or variant, where the molecules are arranged in a crystalline manner belonging to space group P43212 with unit cell dimensions a = 87.47 Angstrom , b = 87.47 Angstrom , c = 135.03 Angstrom , alpha = beta = gamma = 90.0 deg. , and which effectively diffracts X-rays for determination of the atomic coordinates of PDE1B polypeptide to a resolution of about 1.8 Angstrom ;

(4) a computer (V):

(a) for producing a three-dimensional representation of a polypeptide with an amino acid sequence spanning amino acids Thr142-Gln507 listed in (S1), or its homologue, or variant,

(b) for producing a three-dimensional representation of molecule or molecular complex comprising (C1),

(c) for producing three-dimensional representation of molecule or molecular complex comprising the atomic coordinates having a root mean square deviation of less than +/-2.0, 1.7, 1.5, 1.2, 1.0, 0.7, 0.5 or even 0.2 Angstrom from the atomic coordinates for the carbon back bone atoms listed in (C1), or

(d) for producing three-dimensional representation of molecule or molecular complex comprising a binding site defined by (C1), or a structural coordinates of portion of the residues in (C1), or the structural coordinates of one or more PDE1B amino acids in (S1) chosen from His223, His373, Thr385, Leu388, Ser420, Gln421, and Phe424, where (V) comprises a computer readable data storage medium comprising a data storage material encoded with computer-readable data, where the data comprises the structure coordinates (C1) of PDE1B C-terminal catalytic domain crystal, as given in the specification or its portions, a working memory for storing instructions for processing the computer readable data, a central processing unit coupled to the working memory and to the computer-readable data storage medium for processing the computer-machine readable data into three-dimensional representation, and a display coupled to the central processing unit for displaying the representation;

(5) identifying a potential ligands for PDE1B, or its homologues, analogues or variants, by displaying three-dimensional structures of PDE1B enzymes, or its portions, as defined by (C1), on a computer display screen, optionally replacing one or more PDE1B amino acid residues listed in (S1), or one or more of the amino acids that are near the binding pocket in PDE1B catalytic domain at a distance of 10 Angstrom , 7 Angstrom or 4 Angstrom away from the ligand of PDE1B, or one or more amino acid residues chosen from His223, His373, Thr385, Leu388, Ser420,

Gln421, and Phe424, in the three-dimensional structure with a different naturally occurring amino acid or an unnatural amino acid, employing the three-dimensional structure to design or select the ligand, contacting the ligand with PDE1B, or its variant, in the presence of one or more substrates, measuring the ability of the ligand to modulate the activity of PED1B, computationally modifying the structure of the ligand, and computationally determining the fit of the modified ligand with the three-dimensional coordinates of PDE1B, or its portions;

(6) treating psychological disorders comprising administering to a patient in need of treatment the pharmaceutical compositions of ligands identified by structure-based drug design using the atomic coordinates substantially similar to or portions of (C1), where the psychological disorder is chosen from multiple variants of schizophrenia, anxiety disorders, movement disorders chosen from Huntington's disease, Parkinson's disease and dyskinesia, alcohol and drug addictions, cognitive deficiencies, and mood disorders; and

(7) an expression vector useful in method for preparing a purified catalytic domain of PDE1B comprising a polypeptide with an amino acid sequence spanning amino acids Thr142 to Gln507 listed in (S1) or its homologue or variant.

USE - (I) is useful for designing, modifying and assessing the activity of potential inhibitors of the enzyme, that are useful as psychotherapeutics.

DESCRIPTION OF DRAWING(S) - The figure shows an orthogonal view of the structure of phosphodiesterase 1B (PDE1B) in ribbon representation.

AB     Cyclic nucleotide phosphodiesterases (PDEs) regulate the intracellular concentrations of
       cyclic 3',5'-adenosine and guanosine monophosphates (cAMP and cGMP, respectively) by
       hydrolyzing them to AMP and GMP, respectively.  Family-selective inhibitors of PDEs have
```

been studied for treatment of various human diseases. However, the catalytic mechanism of cyclic nucleotide hydrolysis by PDEs has remained unclear. We determined the crystal structure of the human PDE4D2 catalytic domain in complex with AMP at 2.4 A resolution. In this structure, two divalent metal ions simultaneously interact with the phosphate group of AMP, implying a binuclear catalysis. In addition, the structure suggested that a hydroxide ion or a water bridging two metal ions may serve as the nucleophile for the hydrolysis of the cAMP phosphodiester bond.

AB The catalytic domain of recombinant human PDE3B was expressed in Escherichia coli as inclusion bodies and refolded to form active enzyme. A mutation at tryptophan 1072 in PDE3B disrupts inhibitor binding, but has minimal effect on cAMP hydrolysis. The W1072A mutation caused a 158-fold decrease in affinity for cilostamide, a 740-fold decrease for cGMP, and a 15-fold decrease in affinity for IBMX. The corresponding tyrosine mutation had a smaller effect. However, the K(m) of cAMP for the W1072A mutation was only increased by about 7-fold. The data indicate that the inhibitor binding region is not completely coincident with the substrate binding region. The homologous residue in PDE4B is located on helix 16 within 7A of the predicted bound substrate. A model of PDE3B was constructed based on the X-ray crystal structure of PDE4B.

AB Selective inhibitors against the 11 families of cyclic nucleotide phosphodiesterases (PDEs) are used to treat various human diseases. How the inhibitors selectively bind the conserved PDE catalytic domains is unknown. The crystal structures of the PDE4D2 catalytic domain in complex with (R)- or (R,S)-rolipram suggest that inhibitor selectivity is determined by the chemical nature of amino acids and subtle conformational changes of

the binding pockets. The conformational states of Gln369 in PDE4D2 may play a key role in inhibitor recognition. The corresponding Y329S mutation in PDE7 may lead to loss of the hydrogen bonds between rolipram and Gln369 and is thus a possible reason explaining PDE7's insensitivity to rolipram inhibition. Docking of the PDE5 inhibitor sildenafil into the PDE4 catalytic pocket further helps understand inhibitor selectivity.

ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS

AB To identify amino acid residues involved in PDE3-selective inhibitor binding, we selected eight presumed interacting residues in the substrate-binding pocket of PDE3A using a model created on basis of homology to the PDE4B crystal structure. We changed the residues to alanine using site-directed mutagenesis technique, expressed the mutants in a baculovirus/ Sf9 cell system, and analyzed the kinetic characteristics of inhibition of the mutant enzymes by milrinone and cilostazol, specific inhibitors of PDE3. The mutants displayed differential sensitivity to the inhibitors. Mutants Y751A, D950A, and F1004A had reduced sensitivity to milrinone (K-i changed from 0.66 muM for the recombinant PDE3A to 7.5 to 156 muM for the mutants), and diminished sensitivity to cilostazol (K-i of the mutants were 18- to 371-fold higher than that of the recombinant PDE3A). In contrast, the mutants T844A, F972A and Q975A showed increased K-i for cilostazol but no difference for milrinone from the recombinant PDE3A. Molecular models show that the PDE3 inhibitors cilostazol and milrinone share some of common residues but interact with distinct residues at the active site, suggesting that selective inhibitors can be designed with flexible size against PDE3 active site. Our study implies that highly conserved residuals Y751, D950 and F1004 in the PDE families are key residues for binding of both substrate and inhibitors, and nonconserved T844 may be responsible for the cilostazol selectivity of PDE3A. Detailed knowledge of the structure of inhibitory sites should contribute to development of more potent and specific inhibitory drugs.

AB Cyclic nucleotide phosphodiesterases (PDEs) regulate physiological processes by degrading intracellular second messengers, adenosine-3',5'-cyclic phosphate or guanosine-3',5'-cyclic phosphate. The first crystal structure of PDE4D catalytic domain and a bound inhibitor, zardaverine, was determined. Zardaverine binds to a highly conserved pocket that includes the catalytic metal binding site. Zardaverine fills only a portion of the active site pocket. More selective PDE4 inhibitors including rolipram, cilomilast and roflumilast have additional functional groups that can utilize the remaining empty space for increased binding energy and selectivity. In the crystal structure, the catalytic domain of PDE4D possesses an extensive dimerization interface containing residues that are highly conserved in PDE1, 3, 4, 8 and 9. Mutations of R358D or D322R among these interface residues prohibit dimerization of the PDE4D catalytic domain in solution.

AB Cyclic nucleotide phosphodiesterase 3A (PDE3A) hydrolyzes cAMP to AMP, but is competitively inhibited by cGMP due to a low k(cat) despite a tight K(m). Cyclic AMP elevation is known to inhibit all pathways of platelet activation, and thus regulation of PDE3 activity is significant. Although cGMP elevation will inhibit platelet function, the major action of cGMP in platelets is to elevate cAMP by inhibiting PDE3A. To investigate the molecular details of how cGMP, a similar but not identical molecule to cAMP, behaves as an inhibitor of PDE3A, we constructed a molecular model of the catalytic domain of PDE3A based on homology to the recently determined X-ray crystal structure of PDE4B. Based on the excellent fit of this model structure, we mutated nine amino acids in the putative catalytic cleft of PDE3A to alanine using site-directed mutagenesis. Six of the nine mutants (Y751A, H840A, D950A, F972A, Q975A, and F1004A) significantly decreased catalytic efficiency, and had k(cat)/K(m) less than 10% of the wild-type PDE3A using cAMP as substrate. Mutants N845A, F972A, and F1004A showed a 3- to 12-fold increase of K(m) for cAMP. Four mutants (Y751A, H840A, D950A, and F1004A) had a 9- to 200-fold increase of K(i) for cGMP in comparison to the wild-type PDE3A. Studies of these mutants and our previous study identified two groups of amino acids: E866 and F1004 contribute commonly to both cAMP and cGMP interactions while N845, E971, and F972 residues are unique for cAMP and the residues Y751, H836, H840, and D950 interact with cGMP. Therefore, our results provide biochemical evidence that cGMP interacts with the active site residues differently from cAMP.

AB Recently, we reported structurally novel PDE4 inhibitors based on 1,4-benzodiazepine derivatives. The main interest in developing bezodiazepine-based PDE4 inhibitors is in their lack of adverse effects of emesis with respect to rolipram-like compounds. A large effort has thus been made toward the structural optimization of this series. In the absence of structural information on the inhibitor binding mode into the PDE4 active site, 2D-QSAR (H-QSAR) and two 3D-QSAR (CoMFA and CoMSIA) methods were applied to improve our understanding of the molecular mechanism controlling the PDE4 affinity of the benzodiazepine derivatives. As expected, the CoMSIA 3D contour maps have provided more information on the benzodiazepine interaction mode with the PDE4 active site whereas CoMFA has built the best tool for activity prediction. The 2D pharmacophoric model derived from CoMSIA fields is consistent with the crystal structure of the PDE4 active site reported recently. The combination of the 2D and 3D-QSAR models was used not only to predict new compounds from the structural optimization process, but also to screen a large library of bezodiazepine derivatives.

ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS

AB Class I cyclic nucleotide phosphodiesterases (PDEs) share a catalytic domain containing 18 invariant residues. In cGMP-binding cCMP-specific PDE (PDE5), we showed previously that point mutation of nine of these profoundly decreases k(cat) when the assay is conducted in the presence of Mg2+; seven of these are in the prototypical metal-binding motifs A and B (HX3HXnE) that we identified earlier. Tandem arrangement of two of these metal-binding motifs in PDEs is novel, and whether residues within these motifs are involved in metal support of catalytic activity is a fundamental question in this field. This report shows that mutation of either His-607 (A motif) or His-643 (B motif) to alanine profoundly diminishes support of PDE catalysis by Mn2+ or Mg2+, but mutation of His-647 in B motif or of Glu in either motif does not. H607A and H643A mutants have much greater maximum catalytic rates supported by Mn2+ than that by Mg2+; catalytic activity of H603A mutant is supported weakly by either. In H607A and H643A, K(a)s for Mn2+ and Mg2+ are increased, but the effect of Mn2+ is 2-fold greater than that of Mg2+ in each. Mutation of any of the other conserved residues (Asn-604, Asp-644, His-675, Asp-714, and Asp-754) causes unremarkable changes in Mn2+ or Mg2+ support Of catalysis.

This study identifies specific residues in PDES that contribute to interactions with catalytically relevant metals. The combined data suggest that despite a high degree of sequence similarity between each HX3HXnE motif in PDEs and certain metallo-endopeptidases, PDEs employ a distinct complement of residues for interacting with metals involved in catalysis.

AB The crystal structure of the cyclic phosphodiesterase (CPDase) from Arabidopsis thaliana, an enzyme involved in the tRNA splicing pathway, was determined at 2.5 A resolution. CPDase hydrolyzes ADP-ribose 1",2"-cyclic phosphate (Appr>p), a product of the tRNA splicing reaction, to the monoester ADP-ribose 1"-phosphate (Appr-1"p). The 181 amino acid protein shows a novel, bilobal arrangement of two alphabeta modules. Each lobe consists of two alpha-helices on the outer side of the molecule, framing a three- or four-stranded antiparallel beta-sheet in the core of the protein. The active site is formed at the interface of the two beta-sheets in a water-filled cavity involving residues from two H-X-T/S-X motifs. This previously noticed motif participates in coordination of a sulfate ion. A solvent-exposed surface loop (residues 100-115) is very likely to play a flap-like role, opening and closing the active site. Based on the crystal structure and on recent mutagenesis studies of a homologous CPDase from Saccharomyces cerevisiae, we propose an enzymatic mechanism that employs the nucleophilic attack of a water molecule activated by one of the active site histidines.

AB Cyclic nucleotides are second messengers that are essential in vision, muscle contraction, neurotransmission, exocytosis, cell growth, and differentiation. These molecules are

degraded by a family of enzymes known as phosphodiesterases, which serve a critical function by regulating the intracellular concentration of cyclic nucleotides. We have determined the three-dimensional structure of the catalytic domain of phosphodiesterase 4B2B to 1.77 angstrom resolution. The active site has been identified and contains a cluster of two metal atoms. The structure suggests the mechanism of action and basis for specificity and will provide a framework for structure-assisted drug design for members of the phosphodiesterase family.

AB Platelet cGMP-inhibited cAMP phosphodiesterase (PDE3A) which hydrolyzes cAMP to 5' AMP has been a target for development of therapeutic agents. Currently, there are two PDE3 type-specific inhibitors that are clinically used. One, milrinone, is beneficial in selected patients with heart failure while the other, cilostazol, is a novel potent antiplatelet agent recently approved by the FDA for treatment of intermittent claudication. However, little has been known about the molecular interactions between each inhibitor and the enzyme. To identify such amino acid residues of PDE3A responsible for inhibition, we have utilized a molecular model of the catalytic domain of PDE3A based on the crystal structure of PDE4B. We have mutated nine amino acids to alanine using site-directed mutagenesis, expressed the mutants in a baculovirus/Sf9 cell system, and analyzed the kinetic characteristics of inhibition of the mutant enzyme by milrinone and cilostazol. Certain mutants displayed differential sensitivity to the distinct PDE3 type-specific inhibitors. Mutants Y751A, H840A, D950A and F1004A reduced sensitivity to milrinone (the values of IC50 were from 11.4 to >50 muM, compared with 1.98 muM of the recombinant PDE3A). The same mutants exhibited diminished sensitivity to cilostazol (the values of IC50 of the mutants were 20- to 100-fold higher than that of the recombinant PDE3A). In addition, these same mutants had an increased Ki for cGMP, a competitive inhibitor of PDE3A. By contrast, mutants T844A, F972A and Q975A showed decreased inhibition to cilostazol but no difference for the recombinant PDE3A with milrinone. Mutant F1004A showed 12-fold increase Km for cAMP while the other mutants Y751A, H840A, D950A, T844A, F972A and Q975A had normal or slightly high Km for cAMP. These results suggested that the amino acid residues that interact with the PDE3 type-specific inhibitors are shared while others are distinct. Specific amino acid residues preferentially interact with inhibitory drugs without affecting substrate interaction. Highly conserved amino acid residues (H840, D950 and F1004) in the cyclic nucleotide phosphodiesterase family participated in the interaction with PDE3A inhibitors. Detailed knowledge of the structure of the inhibitory sites should contribute to the development of more potent and specific inhibitory drugs.

AB The known mammalian 3':5'-cyclic nucleotide phosphodiesterases (PDEs) contain a conserved region located toward the carboxyl terminus, which constitutes a catalytic domain, To identify amino acids that are important for catalysis, we introduced substitutions at 23 conserved residues within the catalytic domain of the cGMP-binding cGMP-specific phosphodiesterase (cGBPDE; PDES). Wild-type and mutant proteins were compared with respect to K-m for cGMP, k(cat) and IC50 for zaprinast, The most dramatic decrease in k(cat) was seen with H643A and D754A mutants with the decrease in free energy of binding (Delta Delta G(T)) being about 4.5 kcal/mol for each, which is within the range predicted for loss of a hydrogen bond involving a charged residue, His(643)?S and Asp(754) conserved in all known PDEs and are sarong candidates to be directly involved in catalysis, Substitutions of His(603), His(607), His(647), Glu(672), Asp(714) also produced marked changes in k(cat) and these residues are likely to be important for efficient catalysis, The Y602A and E775A mutants exhibited the most dramatic increases in K-m for cGAMP, with calculated Delta Delta G(T) of 2.9 and 2.8 kcaj/mol, respectively, that these two residues are important for cGMP binding in the catalytic site, Zaprinast is a potent competitive inhibitor of cGB-PDE, but the key residues for its binding differ significantly from those that bind cGMP.

AB Two distinct but related cGMP-inhibited cyclic nucleotide phosphodiesterase (cGI PDE) cDNAs were cloned from rat adipose tissue cDNA libraries. The open reading frame (3324 base pairs) of RcGIP1 encodes 1108 amino acids, including a hydrophobic membrane-association domain in the NH-2-terminal portion and, in the COOH-terminal portion, a putative catalytic domain conserved among all mammalian PDEs which is preceded by a putative regulatory domain that contains three consensus cAMP-dependent protein kinase phosphorylation sites and followed by a hydrophilic COOH-terminal domain. The carboxyl-terminal portion including the conserved domain was expressed as a glutathione S-transferase fusion protein and exhibited cAMP PDE activity which was inhibited by cilostamide, a specific cGI PDE inhibitor. RcGIP1 cDNA hybridizes strongly with RNA from isolated adipocytes, and its mRNA increases dramatically during differentiation of 3T3-L1 adipocytes. The deduced sequence of the second partial cDNA clone (RcGIP2 clone 53B) is highly homologous to the corresponding region of human cardiac cGI PDE cDNA. RcGIP2 cDNA hybridized strongly with rat cardiac tissue RNA and weakly if at all with RNA from rat adipocytes or 3T3-L1 fibroblasts or adipocytes. We suggest that RcGIP1 represents the hormone-sensitive, membrane-associated rat adipocyte cGI PDE and RcGIP2, a cGI PDE from vascular elements in rat adipose tissue.

AB Cyclic nucleotide phosphodiesterases (PDEs) regulate the intracellular concentrations of cyclic 3',5'-adenosine and guanosine monophosphates (cAMP and cGMP, respectively) by hydrolyzing them to AMP and GMP, respectively. Family-selective inhibitors of PDEs have been studied for treatment of various human diseases. However, the catalytic mechanism of cyclic nucleotide hydrolysis by PDEs has remained unclear. We determined the crystal structure of the human PDE4D2 catalytic domain in complex with AMP at 2.4 A resolution. In this structure, two divalent metal ions simultaneously interact with the phosphate group of AMP, implying a binuclear catalysis. In addition, the structure suggested that a hydroxide ion or a water bridging two metal ions may serve as the nucleophile for the hydrolysis of the cAMP phosphodiester bond.

AB On the basis of amino acid sequences and crystal structures of similar enzymes, it is proposed that Met95 of the heme-regulated phosphodiesterase from Escherichia coli (Ec DOS) acts as a heme axial ligand. In accordance with this proposal, the Soret and visible optical absorption and magnetic circular dichroism spectra of the Fe(II) complexes of the Met95Ala and Met95Leu mutant proteins indicate that these complexes are five-coordinated high-spin, suggesting that Met95 is an axial ligand for the Fe(II) complex. However, the Fe(III) complexes of these mutants are six-coordinated low-spin, like the wild-type enzyme. The latter spectral findings are inconsistent with the proposal that the axial ligand to the Fe(III) heme is Met95. To determine the possibility of a redox-dependent ligand switch in Ec DOS, we further analyzed Soret CD spectra and redox potentials, which provide direct evidence on the environmental structure of the heme protein. CD spectra of Fe(III) Met95 mutants were all different from those of the wild-type protein, suggesting indirect coordination of Met95 to the Fe(III) wild-type heme. The redox potentials of the Met95Leu, Met95Ala and Met95His mutants were considerably lower than that of the wild-type enzyme (+70 mV) at -1, -26, and -122 mV vs. SHE, respectively. Thus, it is reasonable to speculate that water (or hydroxy anion) interacting with Met95, rather than Met95 itself, is the axial ligand to the Fe(III) heme.

AB A SAR study on the tertiary alcohol series of phosphodiesterase-4 (PDE4) inhibitors related to 1 is described. In addition to inhibitory potency against PDE4 and the lipopolysaccharide-induced production of TNFalpha in human whole blood, the binding

affinity of these compounds for the human ether-a-go-go related gene (hERG) potassium channel (an in vitro measure for the potential to cause QTc prolongation) was assessed. Four key structural moieties in the molecule were studied, and the impact of the resulting modifications in modulating these activities was evaluated. From these studies, (+)-3d (L-869,298) was identified as an optimized structure with respect to PDE4 inhibitory potency, lack of binding affinity to the hERG potassium channel, and pharmacokinetic behavior. (+)-3d exhibited good in vivo efficacy in several models of pulmonary function with a wide therapeutic index with respect to emesis and prolongation of the QTc interval.

AB The catalytic domain of recombinant human PDE3B was expressed in Escherichia coli as inclusion bodies and refolded to form active enzyme. A mutation at tryptophan 1072 in PDE3B disrupts inhibitor binding, but has minimal effect on cAMP hydrolysis. The W1072A mutation caused a 158-fold decrease in affinity for cilostamide, a 740-fold decrease for cGMP, and a 15-fold decrease in affinity for IBMX. The corresponding tyrosine mutation had a smaller effect. However, the K(m) of cAMP for the W1072A mutation was only increased by about 7-fold. The data indicate that the inhibitor binding region is not completely coincident with the substrate binding region. The homologous residue in PDE4B is located on helix 16 within 7A of the predicted bound substrate. A model of PDE3B was constructed based on the X-ray crystal structure of PDE4B.

AB Selective inhibitors against the 11 families of cyclic nucleotide phosphodiesterases (PDEs) are used to treat various human diseases. How the inhibitors selectively bind the conserved PDE catalytic domains is unknown. The crystal structures of the PDE4D2 catalytic domain in complex with (R)- or (R,S)-rolipram suggest that inhibitor selectivity

is determined by the chemical nature of amino acids and subtle conformational changes of the binding pockets. The conformational states of Gln369 in PDE4D2 may play a key role in inhibitor recognition. The corresponding Y329S mutation in PDE7 may lead to loss of the hydrogen bonds between rolipram and Gln369 and is thus a possible reason explaining PDE7's insensitivity to rolipram inhibition. Docking of the PDE5 inhibitor sildenafil into the PDE4 catalytic pocket further helps understand inhibitor selectivity.

AB The GAFa domain of the cGMP-binding, cGMP-specific phosphodiesterase (PDE5A) was modeled on the crystal structure of PDE2A GAF domain and residues involved in cGMP binding identified. Tandem GAFa and GAFb domains of PDE5A, expressed in Escherichia coli, bound cGMP (K(d) 27 nM). Mutation of aspartate-299 in GAFa, suggested earlier to be critical for cGMP binding, did not abrogate cGMP binding, but mutation of F205, which formed a stacking interaction with the guanine ring of cGMP, led to complete loss of cGMP binding. Therefore, the GAFa domain of PDE5A adopts a structure similar to the GAFb domain of PDE2A, and provides the sole site for cGMP binding in PDE5A.

AB Cyclic nucleotide phosphodiesterases (PDEs) regulate all pathways that use cGMP or cAMP as a second messenger. Five of the 11 PDE families have regulatory segments containing GAF domains, 3 of which are known to bind cGMP. In PDE2 binding of cGMP to the GAF domain causes an activation of the catalytic activity by a mechanism that apparently is shared even in the adenylyl cyclase of Anabaena, an organism separated from mouse by 2 billion years of evolution. The 2.9-A crystal structure of the mouse PDE2A regulatory segment reported in this paper reveals that the GAF A domain functions as a dimerization locus.

The GAF B domain shows a deeply buried cGMP displaying a new cGMP-binding motif and is the first atomic structure of a physiological cGMP receptor with bound cGMP. Moreover, this cGMP site is located well away from the region predicted by previous mutagenesis and structural genomic approaches.

AB Recently, we reported that 4-catechol-substituted cis-(+/-)-4a,5,6,7,8,8a- hexa- and cis-(+/-)-4a,5,8,8a-tetrahydro-2H-phthalazin-1-ones show potent inhibition of phosphodiesterase (PDE4) activity, while the corresponding trans racemic mixtures exhibit only weak to moderate activity. To determine the absolute configuration and PDE4 inhibitory activity of the individual cis-enantiomers, several optically active phthalazinones have been synthesized. The enantiomers of the various gamma-keto acids, used as starting materials, were resolved in a classical way by the formation of diastereomeric salts, and each was converted to optically active phthalazinone in an enantioselective manner. The absolute configuration of the (+)-enantiomer of cis-hexahydrophthalazinone (+)-12 was determined by X-ray crystallography. The carbon atoms at the 4a and 8a positions were found to have the S- and R-configuration, respectively. In the present series of hexa- and tetrahydrophthalazinones, stereoselectivity for PDE4 inhibition is observed; the cis-(+)-enantiomers of the phthalazinones display high inhibitory activity, whereas their (-)-counterparts exhibit only weak to moderate activity. It is likely that all cis-(+)-phthalazinones have a (4aS,8aR)-configuration and vice versa for the cis-(-)-analogues. In the current series, the N-adamantan-2-yl analogue (+)-14 shows the most potent inhibition of PDE4 (pIC(50) = 9.3); the corresponding (-)-enantiomer is 250-fold less active. In addition, the N-substituted tetrahydrophthalazinones under study were investigated for their in vivo antiinflammatory activities by examining the suppression of arachidonic acid (AA) induced mouse ear edema formation. In this assay analogues (+)-14 and (+)-15 were found to be potent antiinflammatory agents showing about 50% inhibition at 30 micromol/kg po.

AB The crystal structure of the semireduced form of cyclic nucleotide phosphodiesterase (CPDase) from Arabidopsis thaliana has been solved by molecular replacement and refined at the resolution of 1.8 A. We have previously reported the crystal structure of the native form of this enzyme, whose main target is ADP-ribose 1",2"-cyclic phosphate, a product of the tRNA splicing reaction. CPDase possesses six cysteine residues, four of which are involved in forming two intra-molecular disulfide bridges. One of these bridges, between Cys-104 and Cys-110, is opened in the semireduced CPDase, whereas the other remains intact. This change of the redox state leads to a conformational rearrangement in the loop covering the active site of the protein. While the native structure shows this partially disordered loop in a coil conformation, in the semireduced enzyme the N-terminal lobe of this loop winds up and elongates the preceding alpha-helix. The semireduced state of CPDase also enabled co-crystallization with a putative inhibitor of its enzymatic activity, 2',3'-cyclic uridine vanadate. The ligand is bound within the active site, and the mode of binding is in agreement with the previously proposed enzymatic mechanism. Selected biophysical properties of the oxidized and the semireduced CPDase are also discussed.

AB To identify amino acid residues involved in PDE3-selective inhibitor binding, we selected eight presumed interacting residues in the substrate-binding pocket of PDE3A using a model created on basis of homology to the PDE4B crystal structure. We changed the residues to alanine using site-directed mutagenesis technique, expressed the mutants in a baculovirus/Sf9 cell system, and analyzed the kinetic characteristics of inhibition of the mutant enzymes by milrinone and cilostazol, specific inhibitors of PDE3. The mutants displayed differential sensitivity to the inhibitors. Mutants Y751A, D950A, and F1004A had reduced sensitivity to milrinone (K(i) changed from 0.66 microM for the recombinant PDE3A to 7.5 to 156 microM for the mutants), and diminished sensitivity to cilostazol (K(i) of the mutants were 18- to 371-fold higher than that of the recombinant PDE3A). In contrast, the mutants T844A, F972A and Q975A showed increased K(i) for cilostazol but no difference for milrinone from the recombinant PDE3A. Molecular models show that the PDE3 inhibitors cilostazol and milrinone share some of common residues but interact with distinct residues at the active site, suggesting that selective inhibitors can be designed with flexible size against PDE3 active site. Our study implies that highly conserved residuals Y751, D950 and F1004 in the PDE families are key residues for binding of both substrate and inhibitors, and nonconserved T844 may be responsible for the cilostazol selectivity of PDE3A. Detailed knowledge of the structure of inhibitory sites should contribute to development of more potent and specific inhibitory drugs.

ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS

AB 3',5'-Cyclic nucleotide phosphodiesterases (PDEs) comprise a superfamily of enzymes that were previously divided by their primary structure into two major classes: PDE class I and II. The 3',5'-cyclic AMP phosphodiesterase from Escherichia coli encoded by the cpdA gene does not show any homology to either PDE class I or class II enzymes and, therefore, represents a new, third class of PDEs. Previously, information about essential structural elements, substrate and cofactor binding sites, and the mechanism of catalysis was unknown for this enzyme. The present study shows by computational analysis that the enzyme encoded by the E. coli cpdA gene belongs to a family of phosphodiesterases that closely resembles the catalytic machinery known from purple acid phosphatases and several other dimetallophosphoesterases. They share both the conserved sequence motif, D-(X)(n)-GD-(X)(n)-GNH[E/D]-(X)(n)-H-(X)(n) -GHXH, which contains the invariant residues forming the active site of purple acid phosphatases, a binuclear Fe3+-Me2+-containing center, as well as a betaalphabetaalphabeta motif as a typical secondary structure signature. Furthermore, the known biochemical properties of the bacterial phosphodiesterase encoded by the cpdA gene, such as the requirement of iron ions and a reductant for maintaining its catalytic activity, support this hypothesis developed by computational analysis. In addition, the availability of atomic coordinates for several purple acid phosphatases and related proteins allowed the generation of a three-dimensional model for class III cyclic nucleotide phosphodiesterases. AB The docking methodology was applied to three different therapeutically interesting enzymes: human dihydroorotate dehydrogenase (DHODH), Herpes simplex virus type I thymidine kinase (HSV1 TK) and human phosphodiesterase 4 (PDE4). Programs FlexX, AutoDock and DOCK where used. The three targets represent three distinct cases. For DHODH and HSV1 TK, the

binding modes of substrate and inhibitors within the active site are known, while the binding orientation of cAMP within PDE4 has been solely hypothesized. Active site of DHODH is mainly hydrophobic and the binding mode of the inhibitor brequinar was used as a template for evaluating the docking strategies. The presence of cofactors revealed to be crucial for the definition of the docking site. The HSV1 TK active site is small and polar and contains crystal water molecules and ATP. Docking of thymidine and aciclovir (ACV) within the active site was analyzed by keeping or removing water molecules. It showed the crucial role of water in predicting the binding of pyrimidines and purines. The crystal structure of PDE4 contains magnesium and zinc cations as well as catalytic water molecule but no ligand. Several docking experiments of cAMP and rolipram were performed and the results showed clear-cut dependence between the ligand orientation and the presence of metals in the active site. All three cases show specific problems of the docking methodology, depending on the character of the active site.

AB Cyclic nucleotide phosphodiesterases (PDEs) regulate physiological processes by degrading intracellular second messengers, adenosine-3',5'-cyclic phosphate or guanosine-3',5'-cyclic phosphate. The first crystal structure of PDE4D catalytic domain and a bound inhibitor, zardaverine, was determined. Zardaverine binds to a highly conserved pocket that includes the catalytic metal binding site. Zardaverine fills only a portion of the active site pocket. More selective PDE4 inhibitors including rolipram, cilomilast and roflumilast have additional functional groups that can utilize the remaining empty space for increased binding energy and selectivity. In the crystal structure, the catalytic domain of PDE4D possesses an extensive dimerization interface containing residues that are highly conserved in PDE1, 3, 4, 8 and 9. Mutations of R358D or D322R among these interface residues prohibit dimerization of the PDE4D catalytic domain in solution.

AB Cyclic nucleotide phosphodiesterase 3A (PDE3A) hydrolyzes cAMP to AMP, but is competitively inhibited by cGMP due to a low k(cat) despite a tight K(m). Cyclic AMP elevation is known to inhibit all pathways of platelet activation, and thus regulation of PDE3 activity is significant. Although cGMP elevation will inhibit platelet function, the major action of cGMP in platelets is to elevate cAMP by inhibiting PDE3A. To investigate the molecular details of how cGMP, a similar but not identical molecule to cAMP, behaves as an inhibitor of PDE3A, we constructed a molecular model of the catalytic domain of PDE3A based on homology to the recently determined X-ray crystal structure of PDE4B. Based on the excellent fit of this model structure, we mutated nine amino acids in the putative catalytic cleft of PDE3A to alanine using site-directed mutagenesis. Six of the nine mutants (Y751A, H840A, D950A, F972A, Q975A, and F1004A) significantly decreased catalytic efficiency, and had k(cat)/K(m) less than 10% of the wild-type PDE3A using cAMP as substrate. Mutants N845A, F972A, and F1004A showed a 3- to 12-fold increase of K(m) for cAMP. Four mutants (Y751A, H840A, D950A, and F1004A) had a 9- to 200-fold increase of K(i) for cGMP in comparison to the wild-type PDE3A. Studies of these mutants and our previous study identified two groups of amino acids: E866 and F1004 contribute commonly to both cAMP and cGMP interactions while N845, E971, and F972 residues are unique for cAMP and the residues Y751, H836, H840, and D950 interact with cGMP. Therefore, our results provide biochemical evidence that cGMP interacts with the active site residues differently from cAMP.

AB Recently, we reported structurally novel PDE4 inhibitors based on 1,4-benzodiazepine derivatives. The main interest in developing bezodiazepine-based PDE4 inhibitors is in their lack of adverse effects of emesis with respect to rolipram-like compounds. A large effort has thus been made toward the structural optimization of this series. In the

absence of structural information on the inhibitor binding mode into the PDE4 active site, 2D-QSAR (H-QSAR) and two 3D-QSAR (CoMFA and CoMSIA) methods were applied to improve our understanding of the molecular mechanism controlling the PDE4 affinity of the benzodiazepine derivatives. As expected, the CoMSIA 3D contour maps have provided more information on the benzodiazepine interaction mode with the PDE4 active site whereas CoMFA has built the best tool for activity prediction. The 2D pharmacophoric model derived from CoMSIA fields is consistent with the crystal structure of the PDE4 active site reported recently. The combination of the 2D and 3D-QSAR models was used not only to predict new compounds from the structural optimization process, but also to screen a large library of bezodiazepine derivatives.

SUMMARY LANGUAGE: English
AB The crystal structure of the cyclic phosphodiesterase (CPDase) from Arabidopsis thaliana, an enzyme involved in the tRNA splicing pathway, was determined at 2.5 Aa resolution. CPDase hydrolyzes ADP-ribose 1'',2''-cyclic phosphate (Appr>p), a product of the tRNA splicing reaction, to the monoester ADP-ribose 1''- phosphate (Appr-1''p). The 181 amino acid protein shows a novel, bilobal arrangement of two alpha s modules. Each lobe consists of two alpha -helices on the outer side of the molecule, framing a three- or four-stranded antiparallel s-sheet in the core of the protein. The active site is formed at the interface of the two s-sheets in a water-filled cavity involving residues from two H-X-T/S-X motifs. This previously noticed motif participates in coordination of a sulfate ion. A solvent-exposed surface loop (residues 100-115) is very likely to play a flap-like role, opening and closing the active site. Based on the crystal structure and on recent mutagenesis studies of a homologous CPDase from Saccharomyces cerevisiae, we propose an enzymatic mechanism that employs the nucleophilic attack of a water molecule activated by one of the active site histidines.

AB Cyclic nucleotides are second messengers that are essential in vision, muscle contraction, neurotransmission, exocytosis, cell growth, and differentiation. These molecules are degraded by a family of enzymes known as phosphodiesterases, which serve a critical

function by regulating the intracellular concentration of cyclic nucleotides. We have determined the three-dimensional structure of the catalytic domain of phosphodiesterase 4B2B to 1.77 angstrom resolution. The active site has been identified and contains a cluster of two metal atoms. The structure suggests the mechanism of action and basis for specificity and will provide a framework for structure-assisted drug design for members of the phosphodiesterase family.

ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS

AB The known mammalian 3':5'-cyclic nucleotide phosphodiesterases (PDEs) contain a conserved region located toward the carboxyl terminus, which constitutes a catalytic domain, To identify amino acids that are important for catalysis, we introduced substitutions at 23 conserved residues within the catalytic domain of the cGMP-binding cGMP-specific phosphodiesterase (cGBPDE; PDES). Wild-type and mutant proteins were compared with respect to K-m for cGMP, k(cat) and IC50 for zaprinast, The most dramatic decrease in k(cat) was seen with H643A and D754A mutants with the decrease in free energy of binding (Delta Delta G(T)) being about 4.5 kcal/mol for each, which is within the range predicted for loss of a hydrogen bond involving a charged residue, His(643)?S and Asp(754) conserved in all known PDEs and are sarong candidates to be directly involved in catalysis, Substitutions of His(603), His(607), His(647), Glu(672), Asp(714) also produced marked changes in k(cat) and these residues are likely to be important for efficient catalysis, The Y602A and E775A mutants exhibited the most dramatic increases in K-m for cGAMP, with calculated Delta Delta G(T) of 2.9 and 2.8 kcaj/mol, respectively, that these two residues are important for cGMP binding in the catalytic site, Zaprinast is a potent competitive inhibitor of cGB-PDE, but the key residues for its binding differ significantly from those that bind cGMP.

AB 7-Benzylamino-6-chloro-2-piperazino-4-pyrrolidinopteridine (7a) is a potent inhibitor of the cAMP-specific phosphodiesterase isoenzyme family PDE4 and induces growth inhibition in a panel of tumor cell lines. In this study, we describe a synthesis that yields 7a and novel derivatives free of positional isomers. The synthesis of alkylamino substituted pteridines is based on the successive nucleophilic aromatic substitution of the chlorine atoms of 2,4,6, 7-tetrachloropteridine. For the reaction with secondary amines, the positional order of reactivity was found to be C4 > C7 > C2 > C6. Final structural proof is given by X- ray crystallography. To unravel structural elements of 7a crucial for the interaction with the target enzyme, the compound was modified systematically. The impact of the modifications on activity was tested by evaluating the ability of the compounds to inhibit cAMP hydrolysis by cAMP-specific phosphodiesterase (PDE4) purified from the solid human large cell lung tumor xenograft LXFL529. Growth inhibitory properties were determined by in vitro treatment of the respective cell line LXFL529L using the sulforhodamine B assay (SRB). The results show that for high activity, the heterocyclic substituent in position 2 of the pteridine ring system requires the presence of a basic nitrogen in 4'-position, as represented by piperazine.

AB Ca2+ and its ubiquitous intracellular receptor calmodulin (CaM) are required in the nervous system, among a host of cellular responses, for the modulation of several important enzymes and ion channels involved in synaptic efficacy and neuronal plasticity. Here, we report that CaM can be replaced by the neuronal calcium sensor NCS-1 both in vitro and in vivo. NCS-1 is a calcium binding protein with two Ca(2+)-binding domains that shares only 21% of homology with CaM. We observe that NCS-1 directly activates two Ca2+/CaM-dependent enzymes (3':5'- cyclic nucleotide phosphodiesterase and protein phosphatase calcineurin). Co-activation of nitric oxide synthase by NCS-1 and CaM results in a higher activity than with CaM alone. Moreover, NCS-1 is coexpressed with calcineurin and nitric oxide synthase in several neuron populations. Finally, injections of NCS-1 into calmodulin-defective cam1 Paramecium partially restore wildtype behavioral responses. With this highly purified preparation of NCS-1, we have obtained crystals suitable for crystallographic structure studies. NCS-1, despite its very different structure, distribution, and Ca(2+)-binding affinity as compared with CaM, can substitute for or potentiate CaM functions. Therefore, NCS-1 represents a novel protein capable of mediating multiple Ca(2+)-signaling pathways in the nervous system.

AB The synthesis of ethyl or methyl 4-substituted or unsubstituted 2-(dimethylamino)-5-pyrimidinecarboxylates 10-20, which is mainly carried out by reaction of ethyl or methyl 2-[(dimethylamino)methylene]-3- oxoalkanoates with 1,1-dimethylguanidine, is described. The above esters were hydrolyzed to the relative carboxylic acids 21-30, which were decarboxylated to the corresponding 2,4-disubstituted pyrimidines 31-40. All the new synthesized pyrimidines were evaluated in spontaneously beating and electrically driven atria from reserpine-treated guinea pigs. Their effects were compared to those induced by milrinone in both atria preparations. Compound 28 (4-benzyl-2-(dimethylamino)-5-pyrimidinecarboxylic acid) was the most effective positive inotropic agent, while the corresponding methyl ester 17 reduced both the contractile force and the frequency of guinea pig atria. An antagonism toward the negative influence exerted by endogenous adenosine on the heart seems to be involved in the contractile activity of compound 28. By contrast, compound 17 might be partial agonist at the purinergic inhibitory (A1) receptor. X-ray analysis carried out on 17 and 28 and molecular modeling investigations extended also to related derivatives allowed a possible rationalization between structure and inotropic activity for this series of compounds.

AB This study tested the hypothesis that a reperfused ischemic myocardial region of the dog heart would be unable to increase its function in response to amrinone, a specific cyclic AMP phosphodiesterase (cAMP-PDE) inhibitor, due to loss of cAMP-PDE activity in the region. The global contractility (+dp/dtmax), regional percent shortening (ultrasonic crystals), and developed force (miniature force gauge) were measured on a continuous basis throughout a 6-hour experiment and regional blood flow (radioactive microspheres) in open-chest pentobarbital- anesthetized mongrel dogs. The left anterior descending coronary artery (LAD) was isolated and ligated for 2 hours and allowed to reperfuse for 4 hours. This myocardial region was compared to a nonischemic region supplied by the circumflex artery. At the end of the 4-hour reperfusion period, 9 dogs were treated with amrinone (5 mg/kg) and three dogs were not treated with amrinone. The hearts were rapidly excised and frozen in liquid nitrogen. Cyclic AMP and cAMP-PDE activity was determined in homogenates of myocardial tissue. Blood flow decreased during occlusion in the LAD region and returned toward control with reperfusion. Flow increased nonsignificantly with amrinone. the basal cyclic AMP content of the two regions was not different. The cAMP-PDE activity was reduced 24% in the LAD region compared to the control region. There were no ischemia-induced changes in the enzyme characteristics. These experiments demonstrated increased global function in the ischemic reperfused myocardium after amrinone was administered (dP/dtmax: 2092 +/- 538 to 3277 +/- 688 mmHg/sec).(ABSTRACT TRUNCATED AT 250 WORDS)

AB Inhibitors of adenosine 3',5'-cyclic phosphate phosphodiesterase III (cAMP PDE III) were studied by using solid-state, solution, and theoretical methods in order to refine a five-point model for positive inotropic activity. Cyclic AMP PDE III inhibitors bear a striking resemblance to cAMP itself. This investigation supports the importance of an overall planar topography for selective and potent cAMP PDE III inhibition. (Possible reasons for the potency of certain nonplanar compounds are discussed.) Cardiotonics like imazodan (1; CI-914) and 2 (CI-930) can readily achieve essentially planar geometries, as shown with X- ray crystallographic, IR, UV, NMR, and theoretical data. Small alkyl substituents that occupy space corresponding to certain portions of the cAMP sugar region increase potency (see, e.g., 2, 4). Selective inhibition of cAMP PDE III can be achieved by mimicking the attractive electrostatic potential associated with the phosphate group (e.g., with an amide) and by providing an additional attractive potential spatially opposite to the previous one, in the vicinity of the adenine N1 and extending to N3 (e.g., with an imidazole), together with a partial dipole moment comparable to the adenine dipole moment. This extends and better defines our five-point model in terms of cAMP, a natural substrate for PDE.

AB The cardiotonic 1,3-dihydro-3,3-dimethyl-5-(1,4,5,6-tetrahydro-6-oxo-3- pyridazinyl)-2H-indol-2-one (1, LY195115) is a potent, competitive inhibitor (Ki = 80 nM) of sarcoplasmic reticulum derived phosphodiesterase (SR-PDE). Moreover, the compound is a potent positive inotrope both in vitro and in vivo. To assist further cardiotonic drug-design studies, we have mapped the three-dimensional structure of 1 using X- ray crystallography. From a global viewpoint, this drug was essentially planar, but two small regions of nonplanarity were apparent. These involved the geminal methyl substituents in the indol-2-one moiety and the C5' methylene unit of the dihydropyridazinone ring. Because of our previous studies involving the bipyridine cardiotonics amrinone and milrinone, the conformational relationship between the plane of the phenyl ring and the horizontal symmetry plane defined by N2', C3', and C4' of 1 was of particular interest. The C6-C5-C3'-C4' dihedral angle was -2.7 degrees, whereas the C6-C5-C3'-N2' dihedral angle was 174.6 degrees. Therefore the two rings maintain a high degree of coplanarity. Compound 4, the congener of 1 possessing a completely unsaturated pyridazinone ring was also studied. In terms of inotropic activity, this compound, devoid of any puckering in the pyridazinone moiety, was equipotent with 1. Methyl substitution at the 4-position of the dihydropyridazinone and pyridazinone rings provided disparate results. Compound 2, the 4-methyl analogue of 1,

was 2-fold more potent than 1, and the methyl substituent probably caused only minor perturbations in overall molecular topology. However 5, the 4-methyl analogue of the pyridazinone 4, was 4.4-fold less active than 4, perhaps as a result of methyl-induced molecular nonplanarity.

AB Griseolic acid, a potent inhibitor of cyclic adenosine 3',5'-monophosphate phosphodiesterase, was isolated from the fermentation broth of Streptomyces griseoaurantiacus SANK 63479. Treatment of griseolic acid with HCl-MeOH gave adenine and pseudo-sugar. The structure of griseolic acid, adenine nucleoside type structure, was elucidated by chemical degradation and X-ray analysis, and was shown to be structure 1.

AB Streptomyces showdoensis SANK 65080 produced terferol, an inhibitor of cyclic adenosine 3',5'-monophosphate phosphodiesterase (cAMP-PDE). NMR spectrometry and X-ray analysis were used to determine the structure of the compound, a new member of the terphenyl family.

AB The sensitivity for recognition of adenosine 3:5'-monophosphate (cAMP) by its coordinate proteins towards chemical changes in the six-membered cyclic phosphate ring has been investigated. A comparison of the interaction parameters of the 3' and 5'-amido analogues (I, II) and of unsubstituted cAMP has been made using two different protein kinases and the phosphodiesterase from bovine heart. Binding affinity and the capacity of the amido analogues to stimulate the phosphotransferase activity of the kinases is greatly reeuced relative to cAMP, the 3'-position being more sensitive towards the modification than the

5'-position. The coordinate noncyclic derivatives, 3'-deoxy-3'-amino-5'- AMP (IV) and 5'-deoxy-5'-amino-3'-amp (iii), were also tested. Surprisingly activity towards protein kinases was found to be considerable for the 5'-deoxy-5'-amino-3'-AMP (III), while the 3'-deoxy-3'-amino-5'-AMP (IV) is practically inactive. A possible reason for this is that the noncylic 5'-analogue (III) may be able to assume a cyclic structure maintained by internal salt formation. The phosphodiesterase splits both cyclic amido analogues but with reduced rates compared to that of natural cAMP. Kinetic data obtained from different methods reveal a stronger affinity for the 5'-analogue (I) than the 3'-analogue (II) for the active site, although the reaction rate at saturated substrate concentration is significantly higher with II than with I. The properties of the amido and the noncyclic amino analogues are discussed with available data from chemotaxis of the cellular slime moulds. Furthermore data of the respective methylene cyclic derivatives are used for a more comprehensive comparison. The above is interpreted in terms of the electronic features of the substitutions and of the changes in bond distances or angles upon replacement of O by NH or CH2 in the cyclic phosphate ring (obtained from X-ray work).

AB A comparison was made of capacity of subcellular fractions of normal and neoplastic (lymphosarcoma) spleen of C57BL mice to hydrolyze adenosine cyclic 2',3'-monophosphate and adenosine cyclic 3',5'-monophosphate. The 2',3'-cyclic nucleotide phosphodiesterase (I) had highest activity in the particulate fraction of the cell whereas the 3',5'- cyclic nucleotide phosphodiesterase (II) had highest activity in the soluble fraction. I activity was higher in tumor tissue than normal tissue, whereas II activity was higher in normal tissue. Total body irradiation of normal mice with 600 rads of X- ray resulted in a drop of I activity 48 hr after exposure, whereas II was unaffected. Imidazol or Mg2+ had no effect on I. The pH optima for I and II were 6.2 and 7.7, resp. The 2 enzymes are probably not identical in mouse spleen.
